

Chironomus balatonicus and *C. muratensis* can live in the same biotopes, as they were found together in a sewage treatment plant (Moldovan, 1987) and in the Brabantsche Biesbosch (a part of the Rhine-Meuse Delta).

As *C. balatonicus* is not treated in currently used keys, it may have been present where *C. muratensis* has been reported (e.g. Smit et al., 1994). Newly identified material revealed the presence of *C. balatonicus* on several locations in the Rhine-Meuse Delta, such as Haringvliet, Biesbosch and Volkerak-Zoommeer. Only larvae from the Haringvliet have been controlled cytotaxonomically.

Acknowledgements

We thank Dr I. Kerkis (Novosibirsk State University) for identifying some specimens of *Chironomus balatonicus* cytologically and A. bij de Vaate and M. van Veen (RI-ZA) for critically reading the manuscript.
