

7. Uurgemiddelden

Toelichting

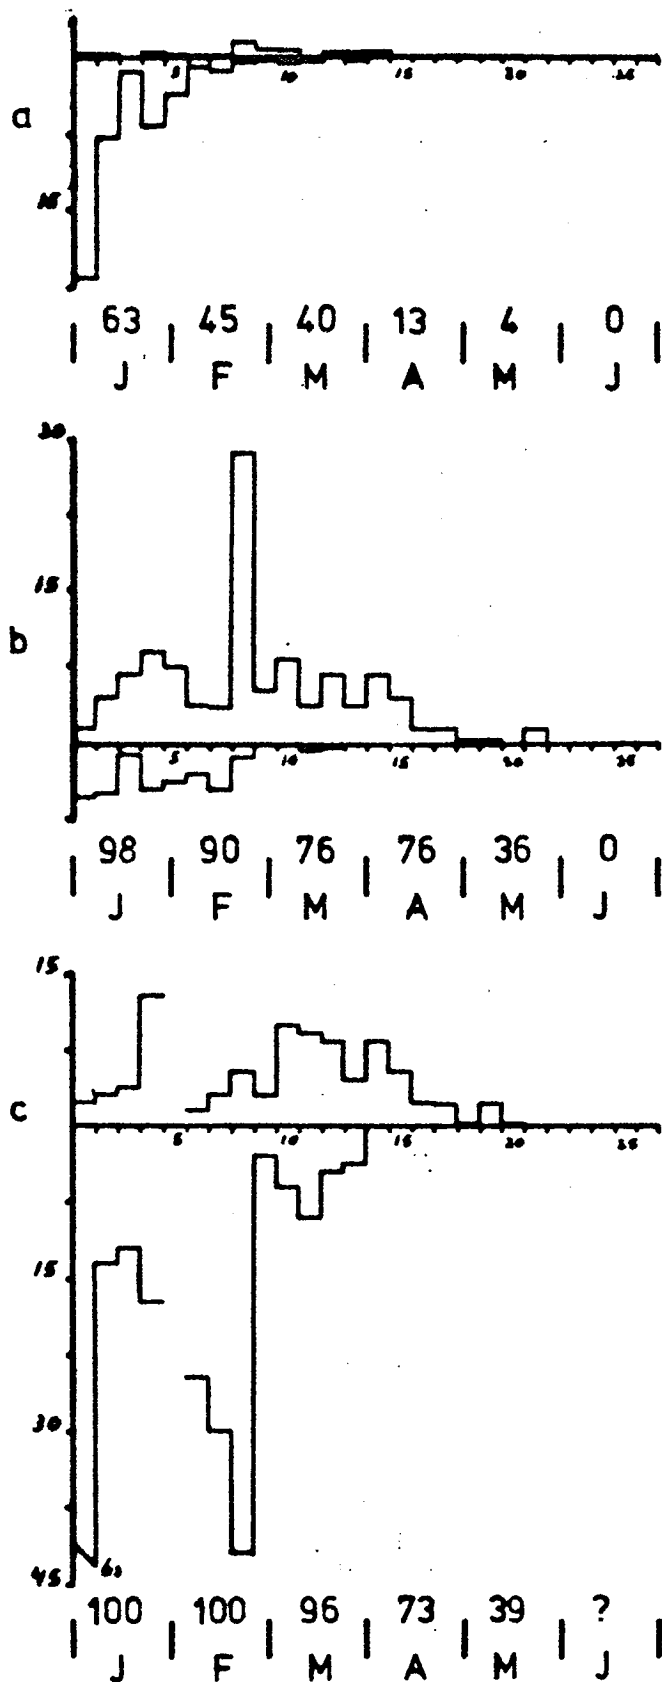

In de volgende figuren is het uurgemiddelde per zeven-daagse periode, per telgebied uitgezet. Hierbij is het uurgemiddelde van de noordwaarts (oostwaarts) passerende vogels boven de abscis uitgezet en van de zuidwaarts (westwaarts) passerende vogels onder de abscis. Voor de meeste soorten zijn de uurgemiddelden van de drie deelgebieden (Zuid-Holland + IJmuiden, Noord-Holland noord en Waddengebied) gegeven.

Onder alle figuren is het presentiepercentage per maand vermeld. Hierbij werd het aantal uren waarin de soort werd waargenomen uitgedrukt in een percentage van het totaal aantal waarnemingsuren in de betreffende maand.

Legend

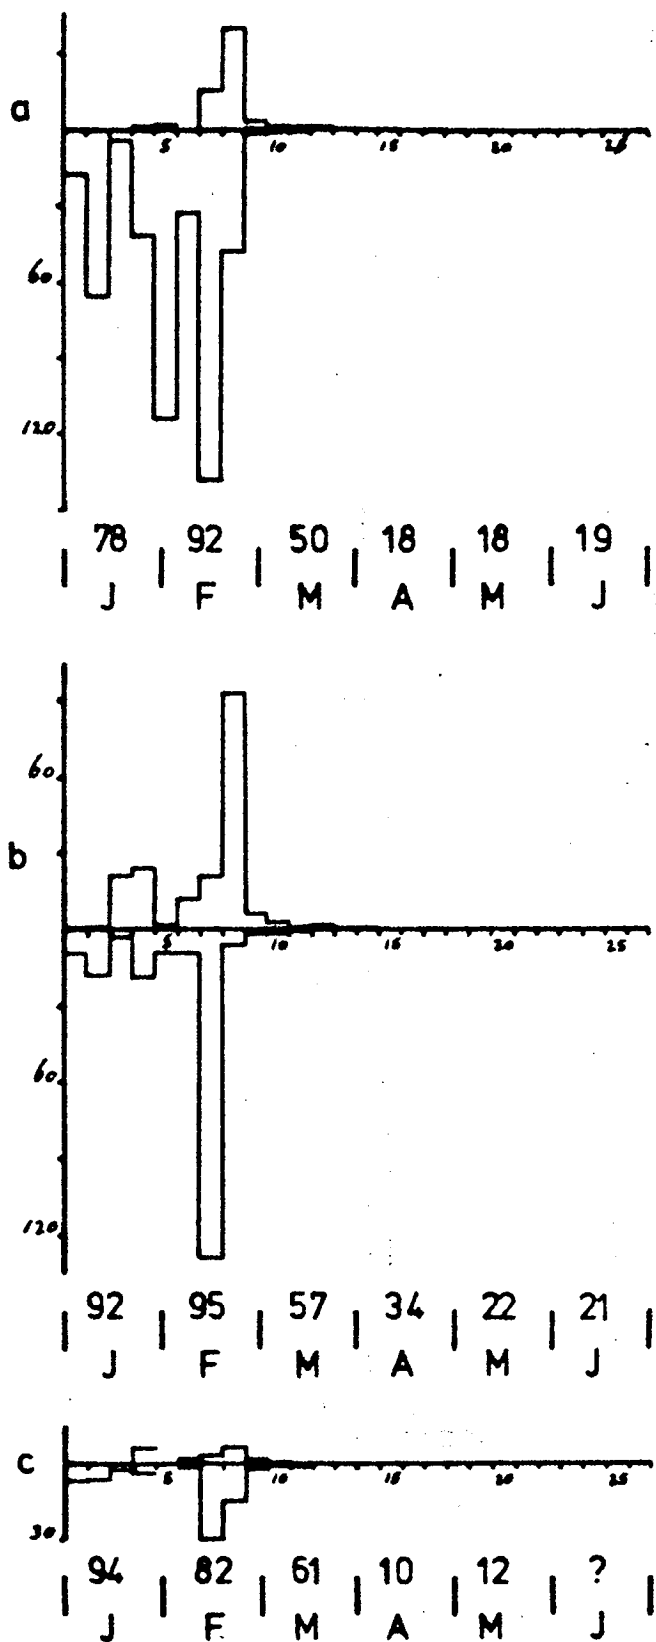

In the following figures the mean numbers of birds per hour per seven-day period are given for each coastal region. In these the mean numbers of birds flying northwards (eastwards) are plotted above the abscis, while the mean numbers of birds flying southwards (westwards) are plotted below it. For most species the mean numbers of all three regions are given (Zuid-Holland + IJmuiden, Noord-Holland north and Wadden Sea area).

Below all figures the percentages of presence are given for every month. These were calculated by dividing all hours in which a certain species was observed during the month concerned by the total number of hours observed in that month. Thus this value gives an indication about the chances of seeing that particular species in that particular month.
