

**MACRODIPLAX CORA (BR.) NEW FOR
LOMBOK, INDONESIA (ANISOPTERA:
LIBELLULIDAE)**

On 18 July 1991, during a visit to Lombok, I took photographs of a male and a female of this species. The locality is a brackish water pond at a palm tree beach, 2 km N of Senggigi beach. Both individuals roosted on the tip of stalks at a height of at least 2 m. From time to time they started for a short feeding flight. At the same site also *Tramea eurybia eurybia* Selys was on wings. Near Sendang Gile, in the northern part of Lombok, at the foot of Mt Rinjani near Sayang, I observed on 20 July also *Orthetrum glaucum* (Br.) and *Euphaea lara lombockensis* McL.

M.A. LIEFTINCK (1953, *Verh. naturf. Ges. Basel* 64: 118-228) listed 28 species from Lombok. Five supplementary species were added by J. BELLE (1994, *Notul. odonatol.* 4: 60-62). Since *M. cora* is not listed here, my record is considered the first one from Lombok, from which island 34 odonate species are now known. *M. cora* has a tropical distribution and is widespread on islands in the Indian and the Pacific Ocean (B.F. BELYSCHIEW, 1968, *Dt. ent. Z. (N.F.)* 15(1/3): 9-13).

I am thankful to Prof. Dr SHIGEO EDA for his kind help with the identification of *M. cora*.
